Conclusion/ Future Work

Introduction:

This is a document for the project “School Management System” by ArcanaSoft from EnigmaForge. It consists of the various important phases and organized diagrams and charts that have directed us to be able to form our software. With the help of planning, communicating, analyzing , testing we were able to dissect the various intricacies of our software and to make these easier to understand, all the members have contributed to making this document.

About Project:

Overview:

This project is a management and administration system for an educational institute. The name of this institute is IPCD (Institute of Professional Career Development). The heads of this institute were in need of a student and school management system that would fulfil the requirements that are discussed later in this document.

Domain:

The domain of this software is related to the management field. By default, this puts certain requirement on our software such as data management, data processing and data analysis. The constraints are what define this software.

Software Development Life Cycle (SDLC):

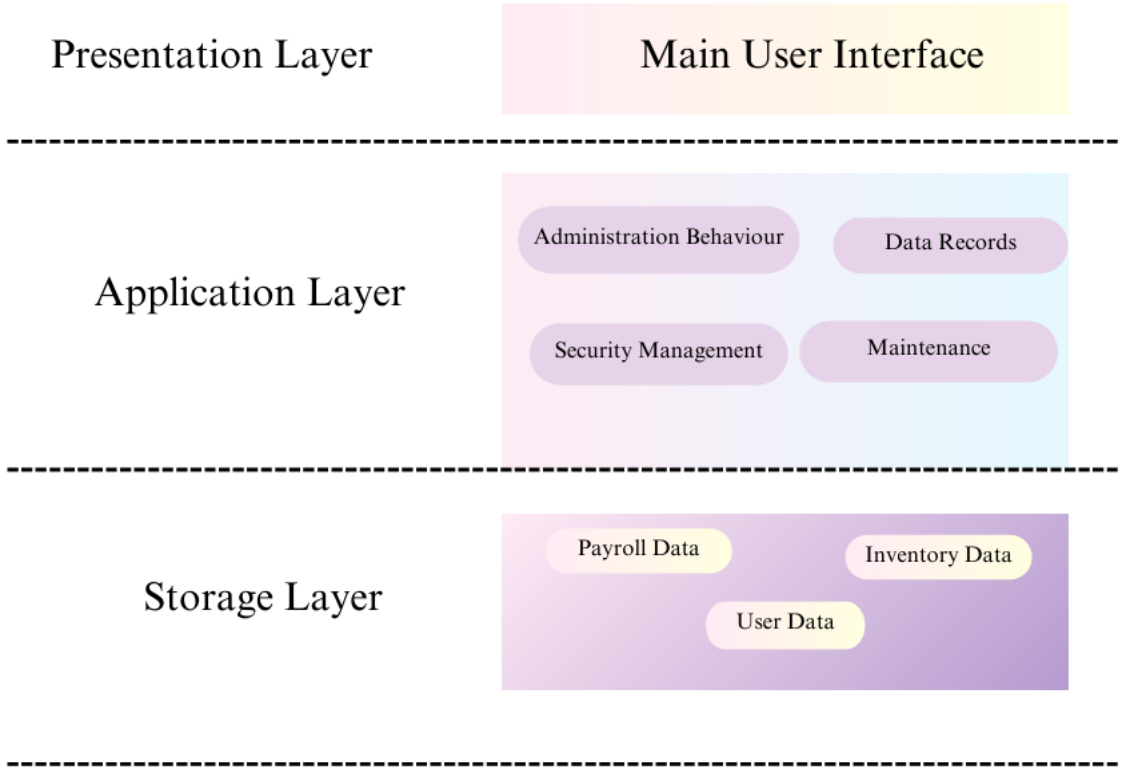
The SDLC committed for this project was Waterfall (Linear) Model.

Why?

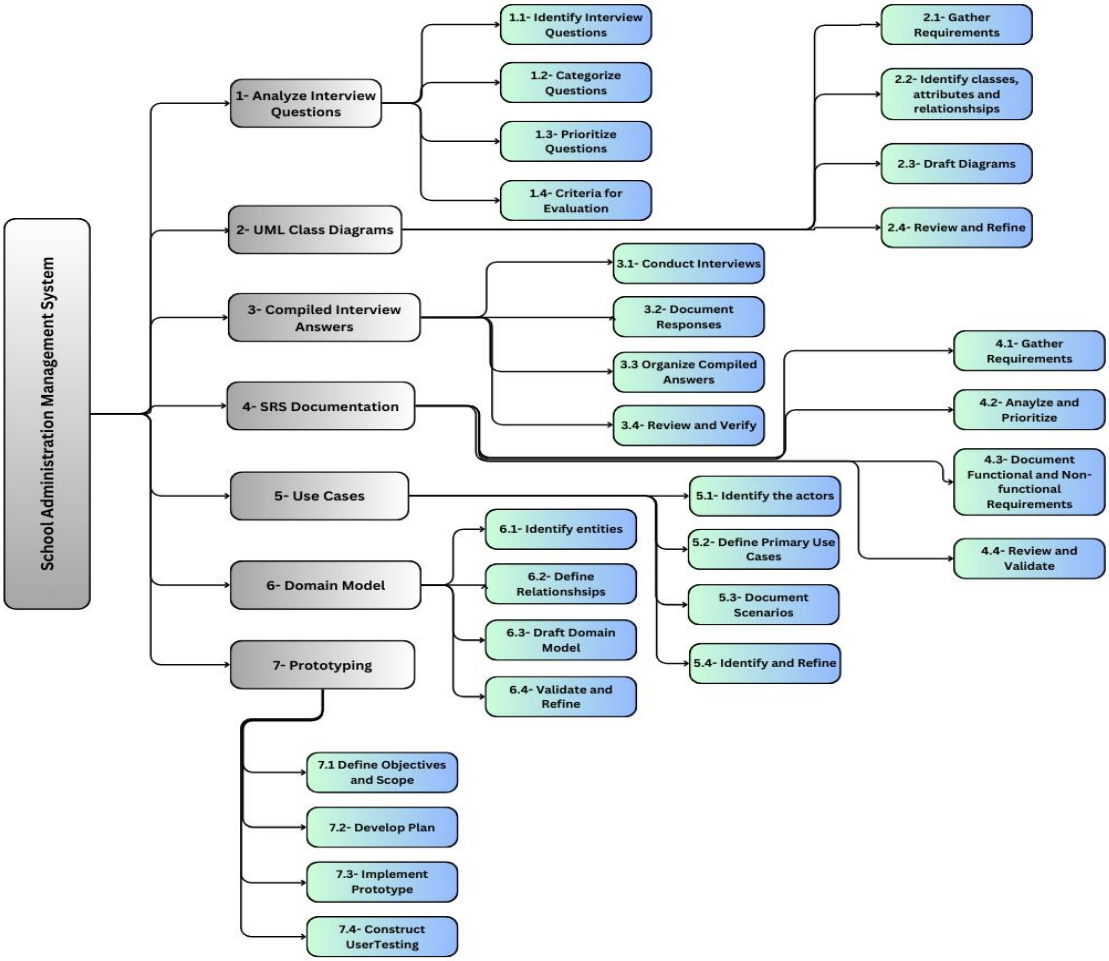
- The requirements were defined very clearly as we conducted interviews with the main stakeholders for this project.

- We were able to easily identify and relate our understanding of the requirements with the clients early on and were given a direction of where we had to go while navigating through the making of this software.
- It was a collaborative start which helped us in being clear of the tasks that we had to do after that.
- Communication, Planning, Analysis were the main areas that required more focus than other stuff. Documentation along side these activities allowed us to be organized and keep a log so that the path ahead could be more clear.

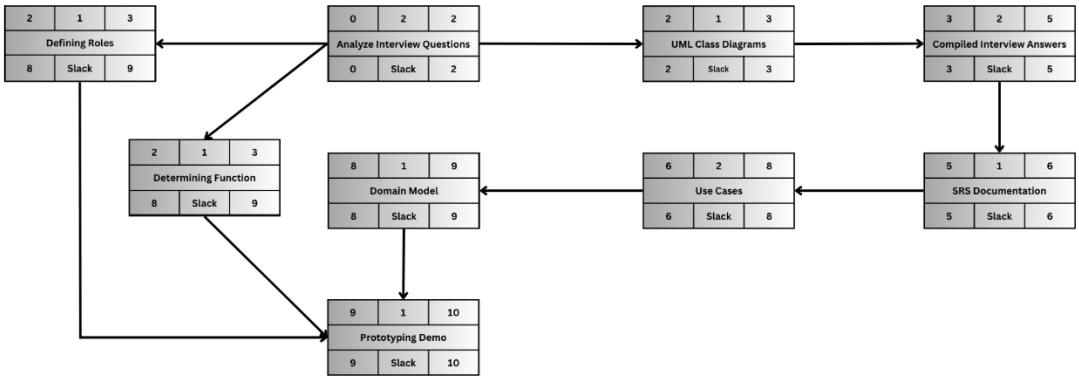
Software Architecture:



Work Breakdown Structure:



Activity on Node (AON):



The activities from the first point to the last point are stated above. If documentation was no required the team could have directly focused on roles, functions etc. for the prototype. The critical path consists of the activities relating to documentation.

System Specifications (User and System Requirements):

Following are the questions we asked our stakeholders during the interview. We focused on the priority of the user requirements and analyzed them to form system requirements within the answers we received.

How many roles will this software accommodate?

User Requirements:

The software should be able to support multiple roles within the school administration, faculty, and staff. Each role should have distinct permissions tailored to their responsibilities. Not only that, each user should be able to log in using role-specific credentials and the software interface should clearly indicate the user's role and permissions.

System Requirements:

- The system should provide functionality for administrators to create, edit, and delete user roles.
- Role permissions should be configurable, allowing administrators to define access levels for each role.
- Users should be authenticated based on their assigned role credentials.
- Access to system functionalities and data should be controlled based on user roles and permissions.

- Role-specific functionalities should be prominently displayed based on the logged-in user's role.

Priority:

- Enable administrators to create, edit, and delete user roles..
- Authenticate users based on role-specific credentials.
- Control access to system functionalities and data based on user roles and permissions

What key aspects should be prioritized in inventory management, and how does the system function in practice?

User Requirements:

The software should be able to track items in the inventory, as well as views the current stock levels. Reports should be generated based on inventory status, usage, and maintenance history.

System Requirements:

- Implement a system to track furniture items in the inventory.
- Include features for adding, updating, and removing items from inventory records.
- Develop a reporting system to generate inventory reports.

Priority:

- Tracking of furniture in the inventory, including details like quantity, location, and status.
- After the basic tracking and maintenance features are in place, inventory reports can be implemented.

Is there a unified payment record encompassing teachers, students, and inventory?

User Requirements:

The payment record should provide a comprehensive view of all financial transactions within the school, including fee collections, payroll disbursements, and inventory purchases. Transactions should be accurately recorded and categorized to ensure transparency and accountability in financial management.

System Requirements:

- Develop a database system to store payment records, categorizing transactions based on their nature (e.g., fees, payroll, inventory).
- Ensure that the payment record is accessible to authorized users and provides a consolidated view of all financial activities within the school.
- Implement functionalities for recording transactions involving teachers (e.g., payroll processing), students (e.g., fee collections), and inventory (e.g., purchases).

Priority:

- A centralized payment record is for ensuring transparency and accountability in financial management.
- Implementing robust transaction recording functionalities is for accurately documenting financial activities involving teachers, students, and inventory.

How should we structure the inventory management system? For instance, should it be organized by item type, usability, recipient, or other criteria?

User Requirements:

The system should be structured in a way that aligns with users' workflows and information retrieval needs, and also facilitates easy access to inventory items. Users need to quickly locate and retrieve inventory items based on various criteria, such as item type, usability, recipient, or other relevant factors.

System Requirements:

- Design a structural framework for the inventory management system that accommodates various organizational criteria, such as item type, usability, recipient, etc.
- Develop a classification system for inventory items based on user-defined criteria, such as item type, usability, recipient, etc.
- Implement mechanisms for categorizing and organizing inventory items within the system according to the chosen classification system.
- Incorporate search and retrieval functionalities into the system to allow users to easily locate inventory items based on their chosen criteria.

Priority:

- Establishing a robust structural framework is for organizing the inventory management system effectively. This provides the foundation upon which the classification system and search functionalities can be built.
- Developing a classification system that aligns with users' needs and workflows is for ensuring that inventory items are organized in a logical and intuitive manner within the system.

How must the leave application system work? Who sends the leave, who approves or denies it, who keeps track of the approval/ denial of the leave?

User Requirements:

Both the students and teacher are able to take a leave. The students request the teacher who deny or accept their application and this is recorded by admin. A teacher can be granted a limited number of leaves which would not be recorded as absence.

System Requirements:

- A student will have to request a leave from the teacher based on any sort of reason. This leave is sent to the teacher for approval or denial.

- The teacher will deny or accept the application by looking at the reason behind the students' absence. The decision of the teacher is sent to the admin who keeps track of a students number of leaves.
- A teacher can be given a limit of absences that they can commit. When they are absent, the limit is decreased. After the leave limit is exceeded, the teacher would be marked as absent.
- The admin has the ability to check every students' and teachers' number of leaves. Both students and teachers days will be displayed to them by the admin's authority who also confirms absence or presence of any teacher or student.

Priority:

- The transfer of leave request denial or acceptance to be sent to admin for keeping record.
- The display of students and teachers, absence and leaves made available to them by the admin so they can keep track.

What are the major needs of the system regarding students ? How are students considered to move up from their current class?

User Requirements:

The students must be provided information on their current status (fees, result, time table). Based on whether their grades fall under the passing criteria they will move up a grade and that will be managed by the admin.

System Requirements:

- The students will be able to access an interface which has their information on it. Everything from fee details to grade reports etc. They will be up to date on the information that is useful for them.
- On the background, the admin will be responsible for updating and managing the students information. Based on real result reports of the students, their class will be moved up.

- Every student will be in a class and that class will follow a certain time table. This will also be assigned by the admin to the class and naturally this will apply to a student who belongs to that particular class.
- Amount due, due dates for the fees will be assigned by the admin. When students pay fee in their interface that information naturally is reported to the admin and the transaction gets confirmed accordingly.

Priority:

- Allowing admin control over the natural progress of every student.
- Multiple students belonging to similar class will have their schedule made available to them simultaneously.
-

What role requires the most intense management? What type of features does this role need?

User Requirements:

The admin is basically the central management system for everything because it is responsible for everything. It requires features ranging from catering to students progress reports, managing inventory and teacher's requests.

System Requirements:

- Establishing connections of student, teacher and inventory to the admin. Crucial functions that are performed by the other classes have to go through a confirmation check through the admin.
- The admin will have functions which will confirm different sorts of actions from student and teacher class. Such as when teachers accept or deny a leave request that decision goes to the admin who confirm it to the student whether the request was denied or accepted. Similarly, students will pay their fees and only when they do this the admin will just confirm the transaction.

- The admin also has it's own functions that it has the responsibility to perform relating to the teacher and students classes. Payment of teachers, result reports updating of students, assigning schedule to students etc.
- The management of inventory is also admins responsibility. The record of furniture will be available to the admin and any updates made to inventory will naturally have to go through the admin.

Priority:

- Making the admin's role be that of a confirmation check for all functions performed by the other roles.
- Based on whatever schedule of updating information, allow admin to update information and assign students schedule.

How are students able to access their schedule and who assigns this schedule to them?

User Requirements:

Students will be able to access their schedule through their interface. This schedule is assigned to them based on what class they are in and is maintained by the admin.

System Requirements:

- An option to view schedule would be available to students. This schedule is the assigned to a class which is same for all the students who belong to the same class and section etc.
- The admin assigns the specific time table to the classes which is determined by the personnel who is in charge of making the time table. This is then given to the admin to maintain within the system.

- The admin can check for errors within the time table manually as they have the free liberty to do so. They can make adjustments if necessary and those adjustments are reflected to all the students whose time table was manipulated by the admin.
- The students do not have the ability to change their courses. They can only view it, the same way they can view their fees. They can not manipulate the time table through any function as the time table is same for the students who belong to the same class as that particular student.

Priority:

- Accessibility of the time table for the students within their environment and restriction from changing the schedule.
- Admin given the ability to manipulate and change the time table when needed or when errors are occurring with time management.

The admin has the authority to manage teachers, students and inventory? How will this work?

User Requirements:

The admin must have secure access to a dashboard where they can manage teacher profiles, student enrollments, and inventory levels, including adding, modifying, and monitoring data.

System Requirements:

- Secure Authentication: The system must provide secure authentication mechanisms, such as password encryption and multi-factor authentication, to ensure that only authorized admins can access the system.

- Data Privacy and Security: The system must implement data privacy and security measures, including access controls and data encryption, to protect sensitive information such as personal details and academic records.

- Real-time Data Updates: The system must support real-time data updates and synchronization to ensure that admin has the latest information available for teachers, students, and inventory.
- Scalability and Performance: The system must be scalable and perform efficiently to handle varying workloads and support growing numbers of users, including teachers, students, and inventory items.

How must the payroll for salary of teacher, fees of students and inventory be managed?

User Requirements:

The payroll system must accurately manage teacher salaries, student fees, and inventory expenses with real-time tracking, automated payments, and secure financial records while ensuring compliance with accounting standards and privacy regulations.

System Requirements:

- Financial Accuracy: The system must ensure the accurate calculation and processing of teacher salaries, student fees, and inventory expenses, including taxes, deductions, and other applicable charges.
- Automated Payments: The system must automate payments and transactions for teacher salaries, student fees, and inventory expenses to ensure timely disbursement and efficient processing.
- Secure Financial Records: The system must maintain secure and organized financial records for teacher salaries, student fees, and inventory expenses, with access controls to protect sensitive financial information.
- Compliance and Reporting: The system must comply with financial regulations and accounting standards, providing reporting and audit trails for teacher salaries, student fees, and inventory expenses.

Do the teachers have multiple places to be? How are they given the ability to manage their time?

User Requirements:

Teachers must be able to efficiently manage their schedules and commitments across multiple locations and classes, with tools for time management, scheduling, and planning that integrate with their overall calendar.

System Requirements:

- Centralized Scheduling: The system must provide a centralized scheduling tool that allows teachers to manage their class schedules, meetings, and commitments across multiple locations.
- Calendar Integration: The system must integrate with teachers' personal calendars and other scheduling tools, providing synchronization and notifications for upcoming classes and events.
- Real-time Updates: The system must offer real-time updates and notifications for schedule changes, including class cancellations or rescheduling, to keep teachers informed and flexible.
- Time Management Tools: The system must include time management tools such as task lists, reminders, and prioritization feature to help teachers organize and optimize their time effectively.

How should students' results be managed? Who can access students' results and manipulate them and how?

User Requirements:

Students' results must be managed securely and accurately, with access and manipulation restricted to authorized personnel such as teachers and administrators and shared with students and parents in compliance with data privacy regulations.

System Requirements:

- Secure Access Control: The system must provide secure access control to students' results, allowing only authorized teachers and administrators to view, modify, or input grades and performance data.
- Data Privacy: The system must ensure the privacy of students' results by protecting data with encryption and access restrictions in compliance with relevant data privacy regulations.
- Transparent Reporting: The system must enable transparent and clear reporting of students' results to students and parents, providing easy access to performance data through a secure portal.
- Audit Trail: The system must maintain an audit trail for changes made to students' results, tracking who accessed or modified the data and when, for accountability and transparency.

Prioritized System Requirements

- The system must offer secure authentication with password encryption and multi-factor authentication to restrict access to authorized admins only.
- The system must securely organize financial records for teacher salaries, student fees, and inventory expenses, with access controls to safeguard sensitive information.
- The system must provide real-time updates and notifications for schedule changes to keep teachers informed and adaptable.
- The system must log changes to students' results, capturing who made edits and when, for accountability and transparency.

Stakeholders:

Principal: Mr. Naveed Ahmed

Admin Manager: Mr Syed Suqlain Raza

Other Personnel:

Coordinator: Miss Zara Mukhtar

Senior Uniting Incharge: Mrs. Tabassum Imran

Junior Uniting Incharge: Mrs. Abida Aslam

Pre-School Incharge: Miss Hina Akbar

Admin Officer: Mr Tahir Rehman

Composer: Mr Tabish Rehman

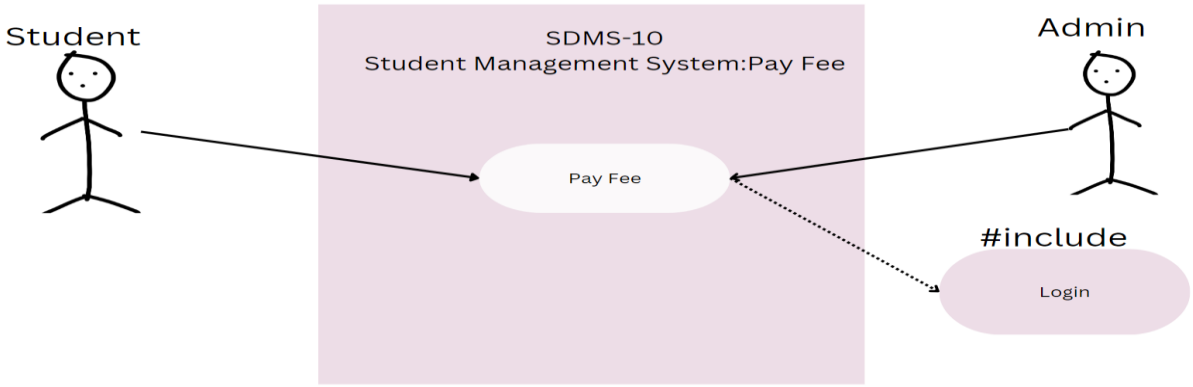
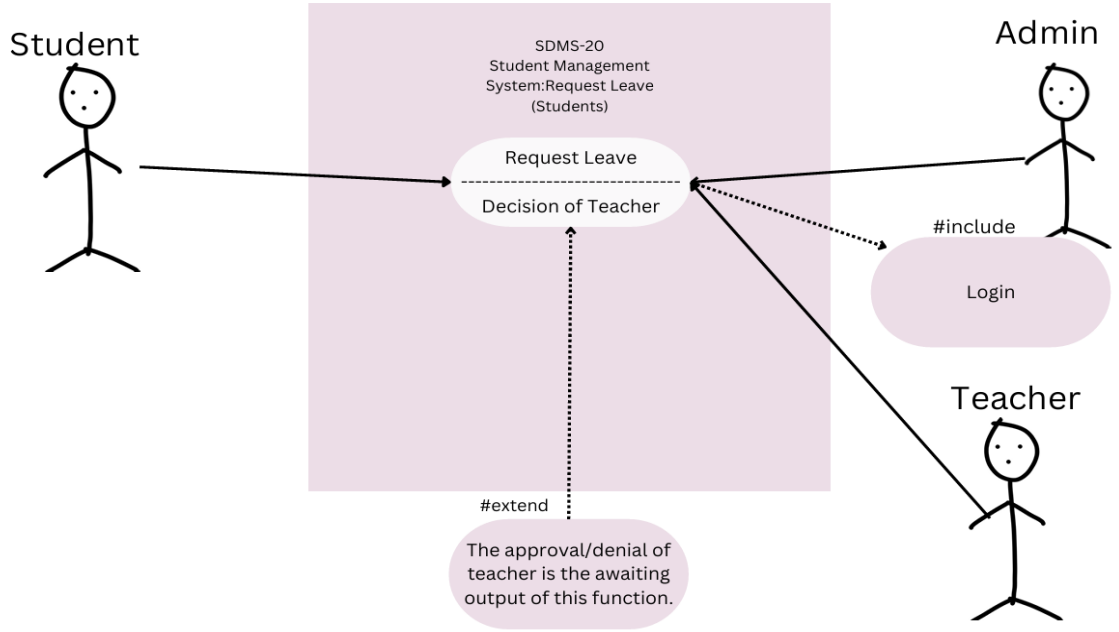
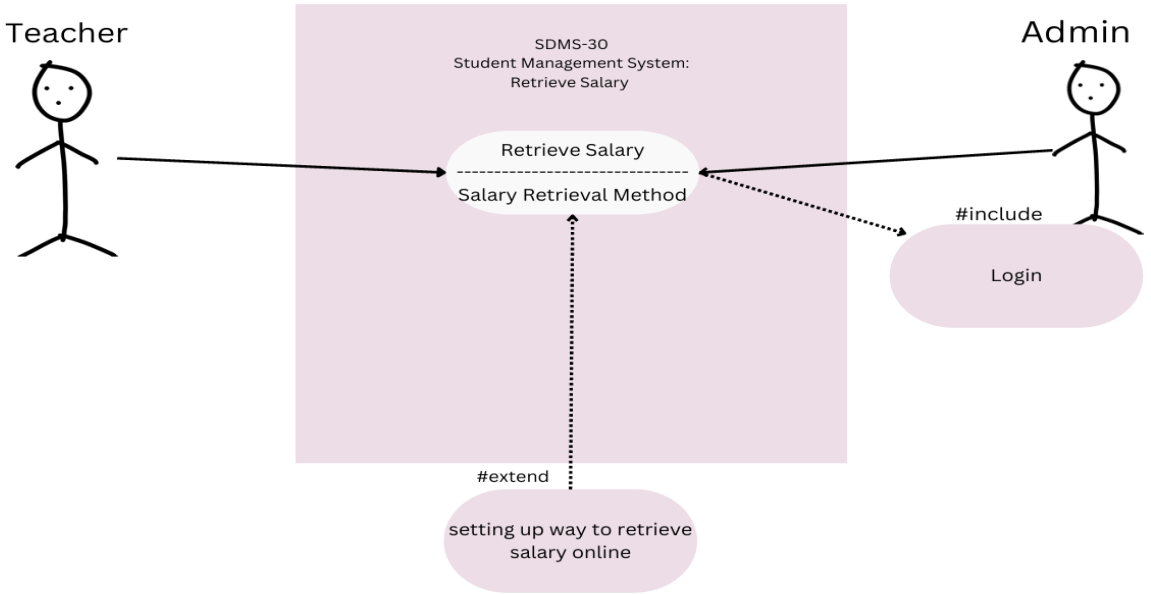
Fully Dressed Use Cases:



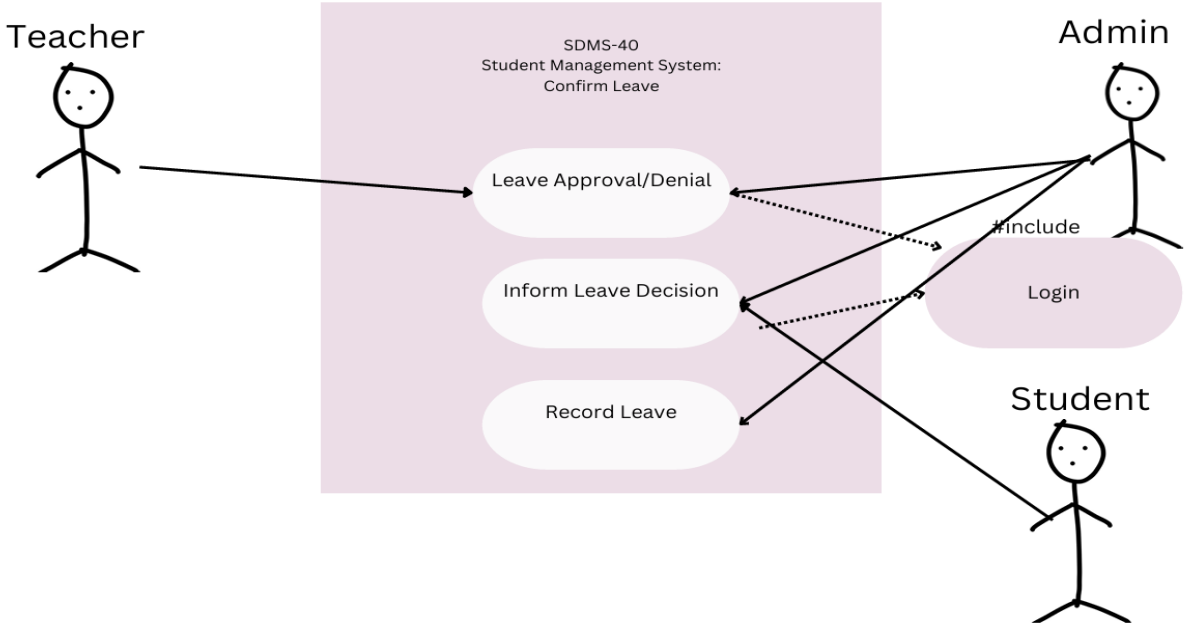
Use case Name:	Pay Fee
Use case ID:	SDMS-10
Brief desc	A student pays their fees
Actor(s):	Primary: Student, Secondary: Admin
Preconditions:	The user must be registered as a student in the school to get their account and login.
Postconditions:	The students' fees will be paid, and their due amount will be updated
Flow of events:	The student will log in to their account. They will be able to view the due fee amount by clicking on pay fee. The students will enter the amount to pay. Once the amount has appeared, they can click on pay. The fee amount will be updated based on the amount of fees that were paid by the student.
Alternative flow or exceptions:	The student can decide to back out of paying their fees any time before confirming the transaction.
Priority:	High
Non-functional requirements:	Ensuring safe and error free transactions



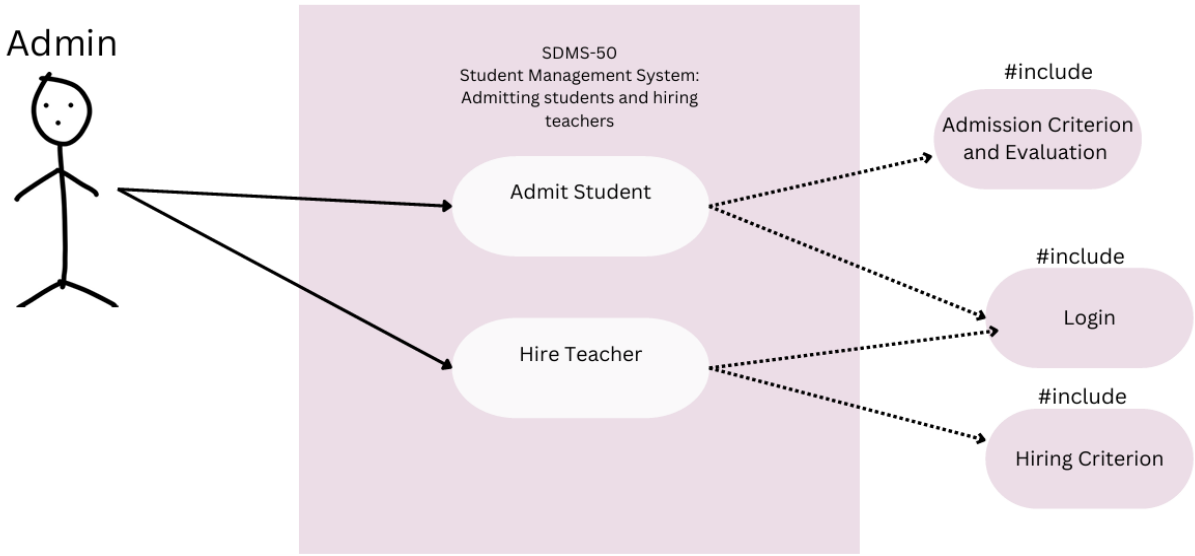
Use case Name:	Request Leave (Students)
Use case ID:	SDMS-20
Brief desc:	A student requests for a leave
Actor(s):	Primary: Student, Secondary: Teacher, Admin
Preconditions:	The user must be a student and must have courses from which they can request a leave from.
Postconditions:	The student will be granted the teacher's decision whenever the teacher accepts or denies the request.
Flow of events:	The student will click on "Request Leave". They can request leave from multiple courses. They can give the reason for requesting leave and the leave is sent to the teacher who is teaching that course. The teacher then denies or accepts the leave based on the reasoning.
Alternative flow or exceptions:	The student never gets the decision of the teacher because of some problem in sending the request.
Priority:	Medium
Non-functional requirements:	The transfer of the leave request from the student to teacher must be efficient and reliable.



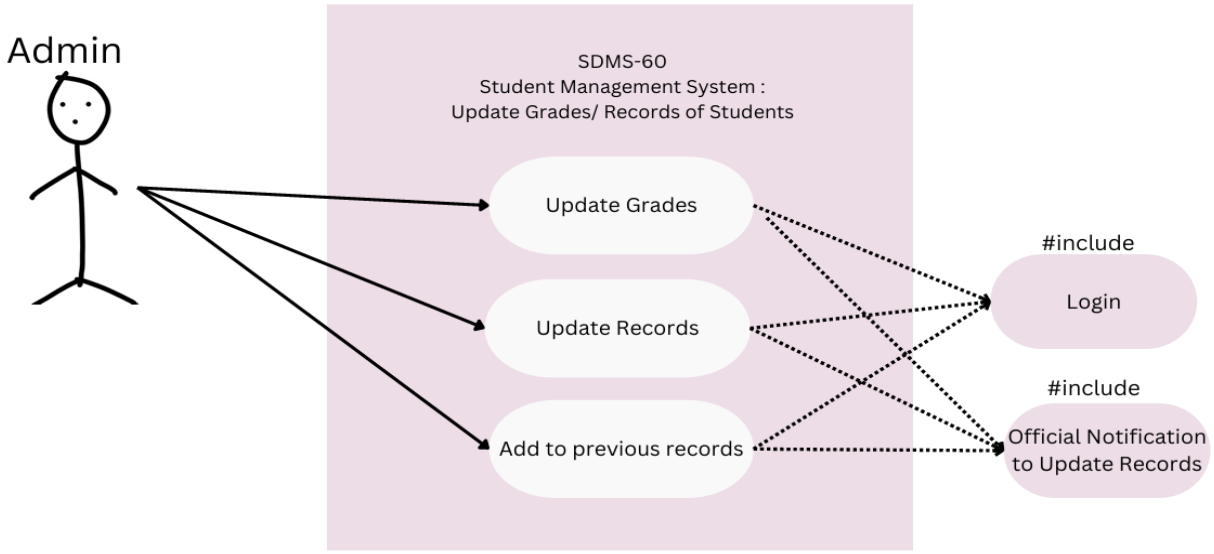
Use case Name:	Retrieve Salary
Use case ID:	SDMS-30
Brief desc:	A teacher retrieves their salary
Actor(s):	Primary: Teacher, Secondary:
Preconditions:	The user must be hired as a teacher.
Postconditions:	The teacher will receive their appropriate salary.
Flow of events:	The teacher will check their billings tab/window. Their salary is updated in this tab. They can choose to accept the salary via online services. They will receive their salary.
Alternative flow or exceptions:	The teacher does not choose online services and wants to be paid via cash would be exception that could occur based on the teacher's resources.
Priority:	High
Non-functional requirements:	The transfer of the salary of multiple teachers should be efficient with no compromises for prolonging the salary date.



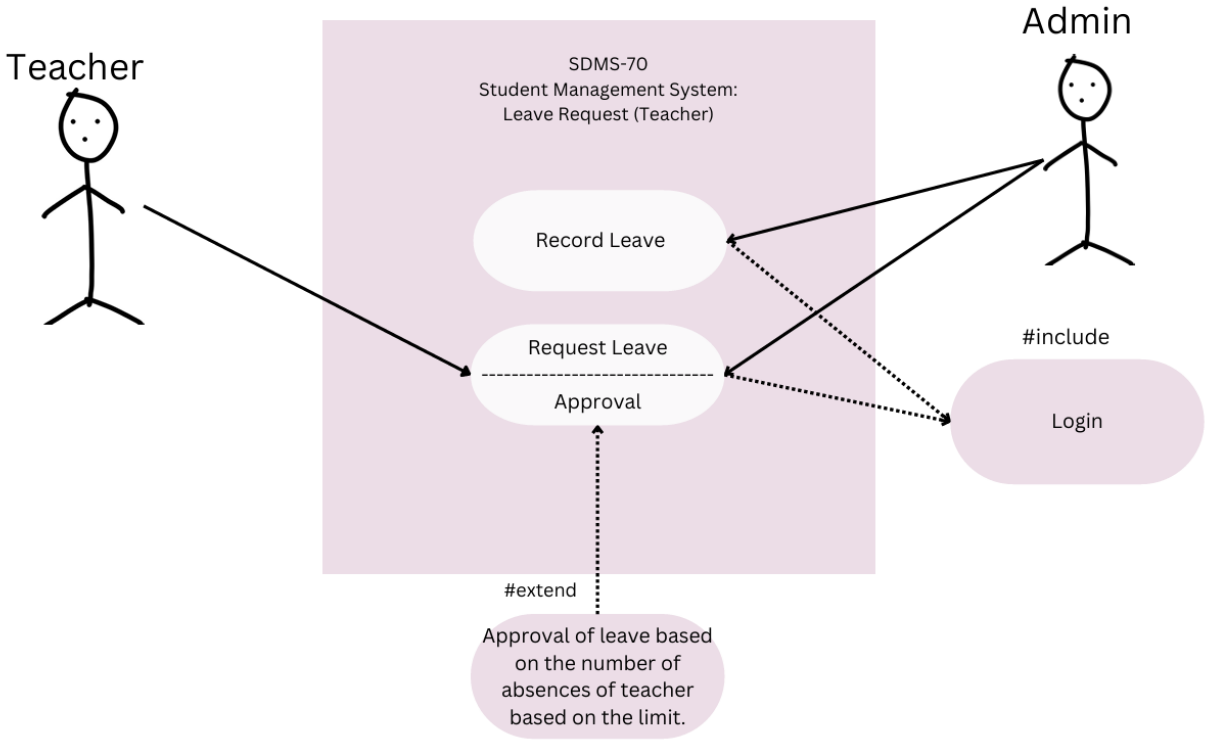
Use case Name:	Confirm Leave
Use case ID:	SDMS-40
Brief desc:	The teacher accepts or denies leave of a student.
Actor(s):	Primary: Teacher, Secondary: Student, Admin
Preconditions:	The teacher must receive a leave request from any of their courses.
Postconditions:	The teacher's decision is informed to the student.
Flow of events:	The teacher will click on "Check Leave Requests". They can accept or deny leave of students who have sent them a leave based on their reasons for the leave. This is officially recorded by the admin and informed to the student.
Alternative flow or exceptions:	An exception could be that the teacher does not receive the leave request due to some request transfer issue.
Priority:	Medium
Non-functional requirements:	The recording of the teachers' decision by the admin must be possible.



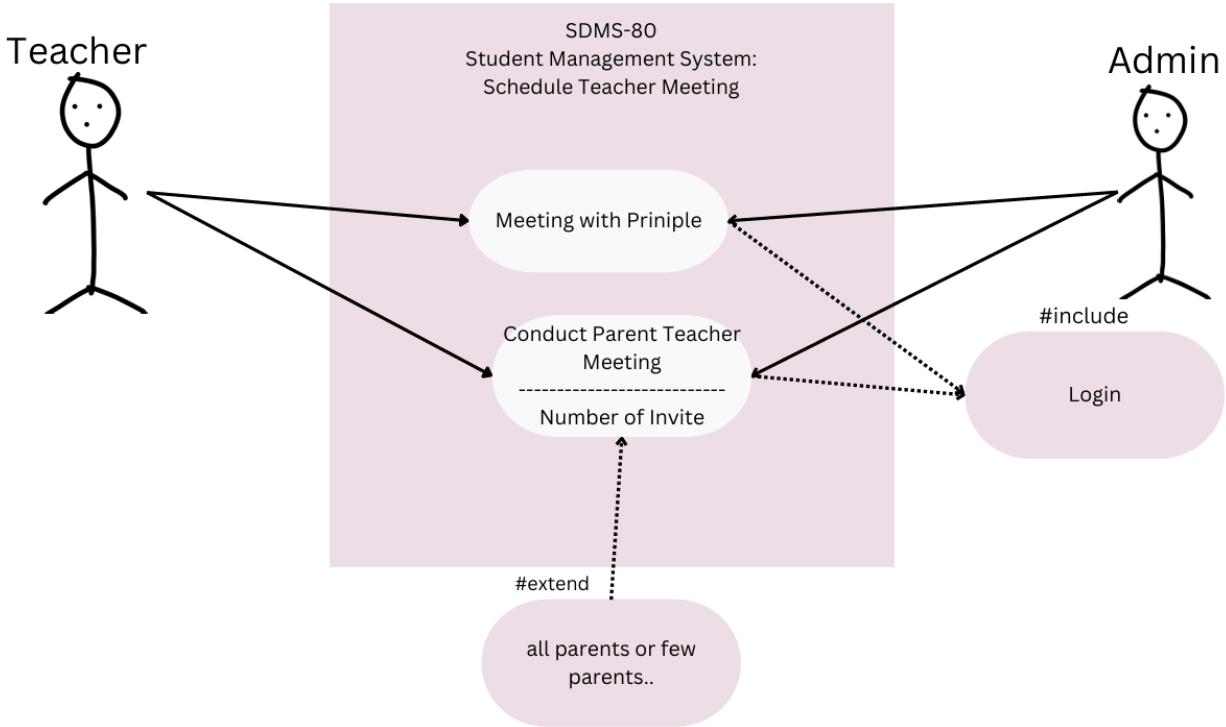
Use case Name:	Add Student/Teacher
Use case ID:	SDMS-50
Brief desc:	Admitting students and hiring teachers
Actor(s):	Primary: Admin
Preconditions:	The admission criteria and hiring criteria of students and teachers respectively should be met.
Postconditions:	The student or teacher will be admitted and hired and have their account created.
Flow of events:	The admin will decide based on certain criteria set by the school to admit a student or hire a teacher or not. If this criterion is met based on several documentation requirements that need to be fulfilled by the person (student, teacher) applying for the school, they shall have an account made for them and thus be officially registered.
Priority:	High



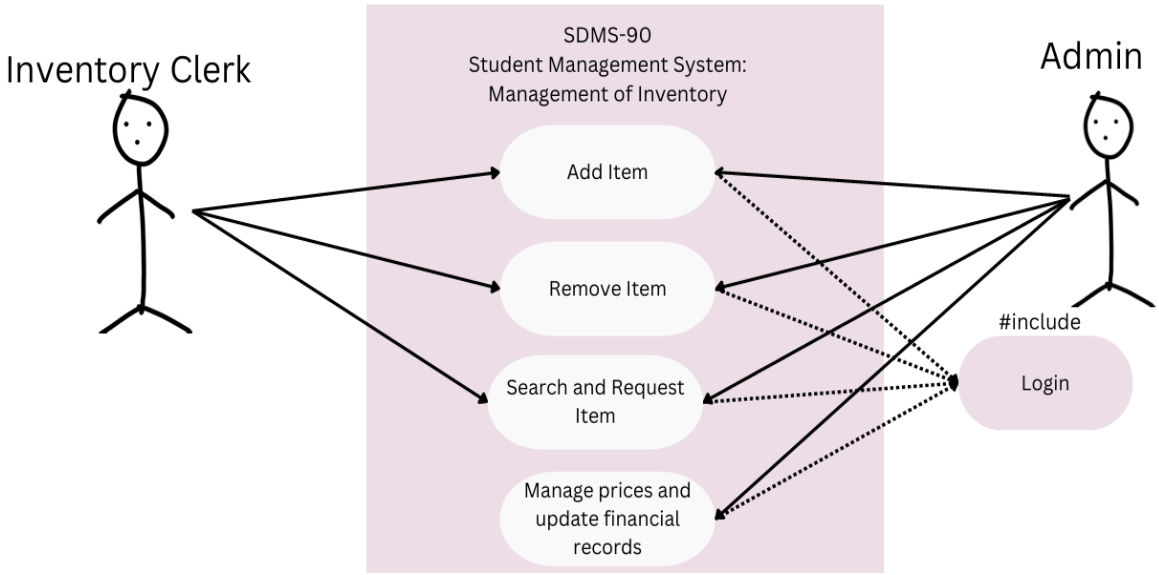
Use case Name:	Update Grades/ Records of Students
Use case ID:	SDMS-60
Brief desc:	The maintenance of students' records.
Actor(s):	Primary: Admin
Preconditions:	The admin must be notified about any changes that need to be made to students' accounts.
Postconditions:	The students' accounts will be updated.
Flow of events:	The students' results, grades, previous records are available to them, and they are managed by an admin. The admin is notified about updating the results after any examinations, test, etc. These records are then available for the students to view from their interface.
Priority:	Medium to High



Use case Name:	Leave Request (Teacher)
Use case ID:	SDMS-70
Brief desc:	A teacher request for a leave
Actor(s):	Primary: Teacher, Secondary: Admin
Preconditions:	The user must be a teacher and must not exceed a limit of leaves available to the teacher.
Postconditions:	The teachers' leave will be confirmed by the admin based on the decision of the higher-ups.
Flow of events:	The teacher will click on “Request Leave”. Their leave will be sent to the admin. The admin will accept the leave based on the criteria of leave not exceeding a certain amount of absence allowed.
Alternative flow or exceptions:	The teacher’s leave accidentally being counted as an absence.
Priority:	Medium to High



Use case Name:	Schedule Teacher Meeting
Use case ID:	SDMS-80
Brief desc:	A teacher schedules a meeting
Actor(s):	Primary: Teacher, Secondary: Admin
Preconditions:	The user must be a teacher and should have students conduct a parent teacher meeting or a personal meeting with the principal.
Postconditions:	The teacher meeting will be scheduled, and the targeted people (students' parent, principle) will be informed
Flow of events:	The teacher will click "Conduct Meeting". They will choose Parents or Principle. After clicking Parents, they have the option to choose some parents or all parents of a particular section of their own. The meeting will be scheduled, and the admin will inform the required people.
Alternative flow or exceptions:	The meeting schedule does not work out for the people who are required basically leading to the scheduled meeting with no results.
Priority:	Low to Medium
Non-functional requirements:	The contact of the people with whom the teacher can conduct the meeting should be easily available to the admin.



Use case Name:	Management of Inventory
Use case ID:	SDMS-90
Brief desc:	Addition/Removal/Price record keeping of Inventory.
Actor(s):	Primary: Inventory Clerk, Secondary: Admin
Preconditions:	The user must be an inventory clerk and must be well informed about the records of the inventory i.g what goods, furniture etc. the school has.
Postconditions:	The addition, removal, price of an inventory item.
Flow of events:	The inventory clerk will search for an item that needs to be managed. If the item is not on the list that means a new item is to be added. Any of the items which are already added to the inventory can be labeled with their price for the admin to maintain the financial records. This also allows inventory clerk to be aware of what items the school has and serve ss proof to when new items are needed based on the condition of a particular item.
Priority:	Medium to High
Non-functional requirements:	The labelling of the item's conditions and price must be accurate to their real-life conditions.

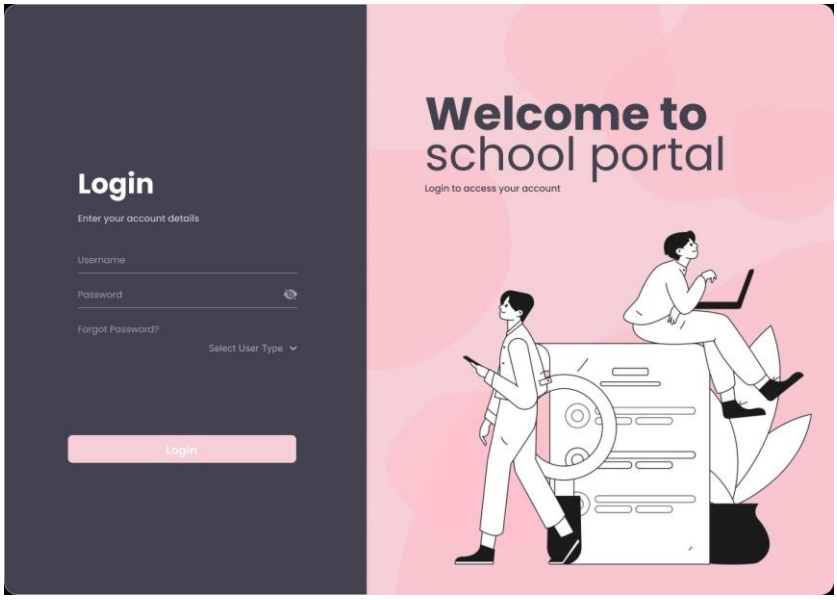
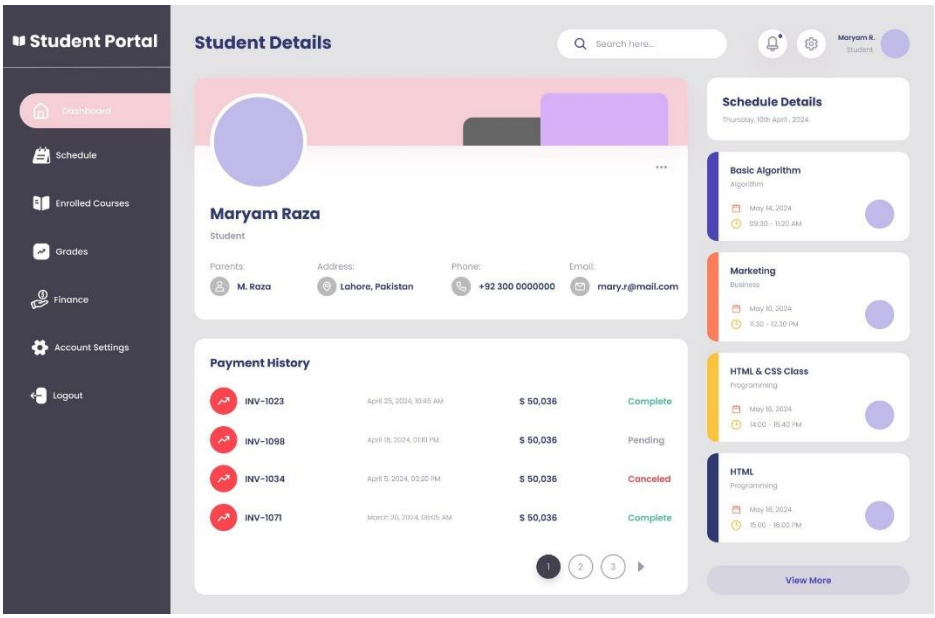
User Interface Explanation:

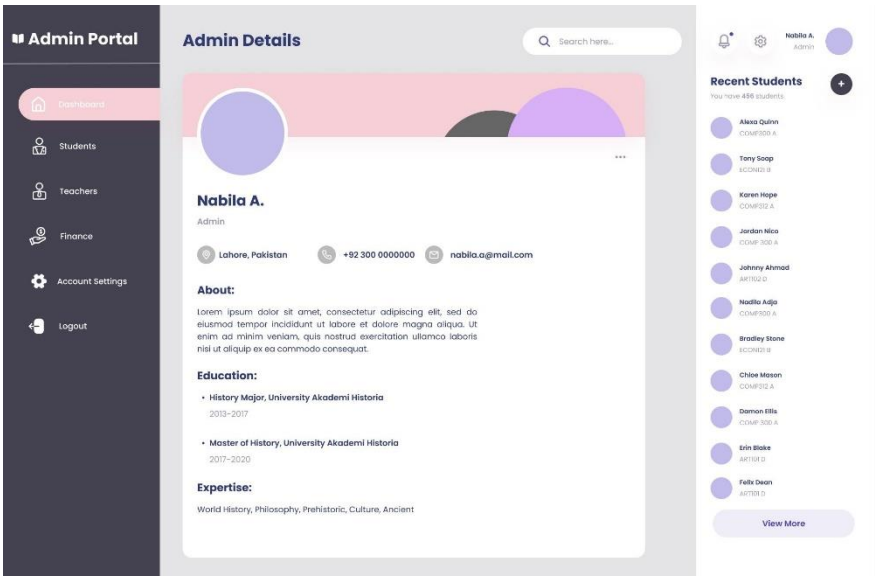


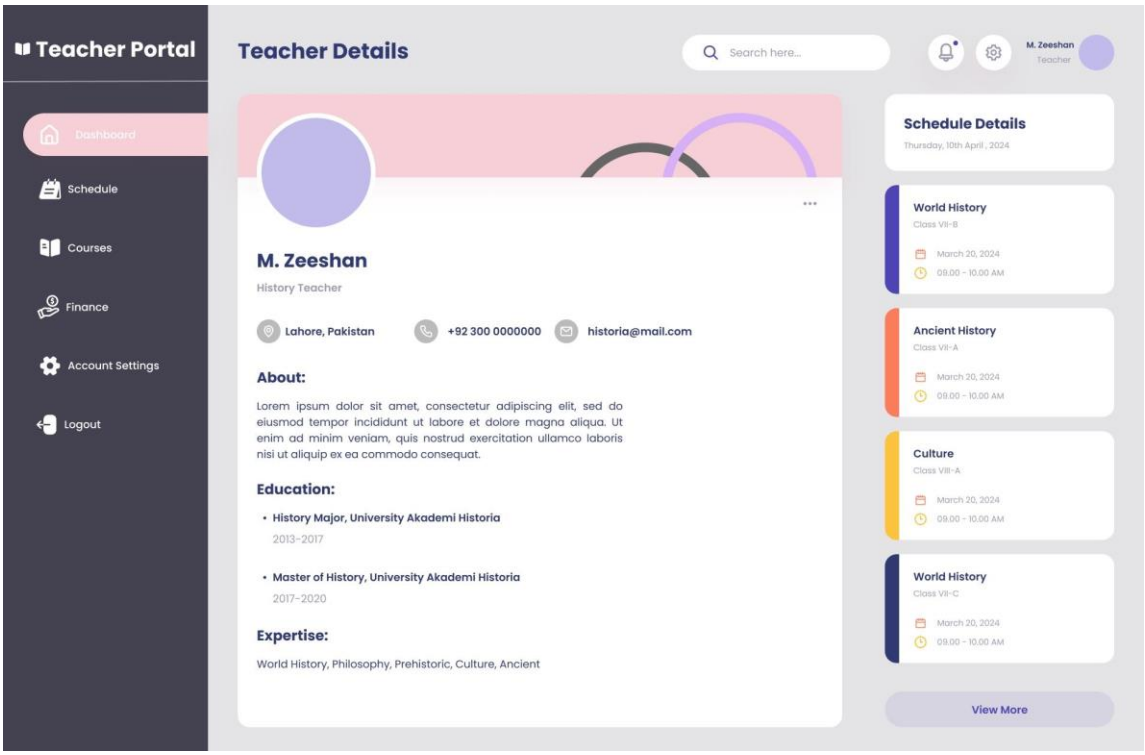
EXPLANATION:

This is the login screen of our software. We can clearly see that a user will be able to enter their username, password and select user type from 3 options (admin, student, teacher)

We can see the difference in the main interface of every account type. There is a label on the top left side of the screen above the multiple tabs that specify the account type.







The students are able to access these settings within the interface. This allows them to manage their fees, view their courses schedule, view record pertaining to their fees and courses, and everything that has been explain in the diagram earlier.

Conclusion/Future Work:

Our software is meant to allow our client to fully be in control for the management of various aspects of their institution and allow the people of the school to be able to maintain security and personalization of their data. This is done based on the requirements given to us by the stakeholder who also collaborated with us while planning and communication regarding this software.

We are interested in using this learning experience to develop software and hear client's feedback, to perfect our software engineering capabilities for our future projects.
